# “Virtual” Lab or “Virtual Lab”: How Students Engage with Laboratory Simulations

Prof Euan Lindsay  
CSU Engineering

# The Purpose of Laboratory Classes

## Some analysis in the literature

- Feisel & Rosa 2005
- Scanlon et al 2002
- Antsaklis et al 1999

## Many good reasons

- Why do \*you\* have laboratory classes?

# There are some downsides:

Expensive to run

Difficult to schedule

Safety issues

Space requirements – need a laboratory

Require physical attendance

# Alternative Modes for Laboratories

## Remote Access

- Hardware can be anywhere
- Safety issues are reduced
- Don't need room around the equipment
- Asynchronous access

## Simulation Access

- No hardware at all

# Proximal labs

# Remote Labs

# Virtual Labs

# Two Necessary Ingredients:

## Separation

- Physical separation in remote labs
- Psychological separation in virtual labs

## Technology-Mediated Interface

- Usually some kind of computer GUI

# Equivalency?

Literature from elsewhere suggests  
perhaps no

Distance Education literature says  
separation causes changes

Technology in Education literature says  
interfaces cause changes

++++

Establishment Reality  
vs  
Maintenance Reality

# Look around and choose two people

One you already know well

One you've never met before today

Look around and choose two people

One you know well

One you've never met before today

Write down the first question you would ask  
upon starting a conversation with them at  
lunchtime

# Different Reality Needs

# The Three Stages of Use

## Initial Use

- The first meeting

## Regular Use

- Ongoing operation

## Expert Use

- Everyday specialist

Different goals at each stage

# Initial Use

*Establishes Credibility*

Is it real?

Can I transfer the learning?

What does this button do?

# Regular Use

## *Establishes Transfer*

Exploring the concepts

How do I get the outcomes I want

Adding extra depth

- The full cockpit simulator

# Expert Use

*Establishes Specialisation*  
*Possibly at the expense of Transfer*

## Improving efficiency

- Shortcuts / hyperkeys

## Changing timescales

- Faster, slower, backwards

# Too Much Fidelity?

# Why is Fidelity Good?

Credibility

Transfer

Engagement

# Credibility

*What are students' options if the data doesn't match their expectations?*

1. Question the data
  - Check for experimental error
2. Question the model
  - Change their understanding of the phenomema (ie **learn something**)
3. Question the credibility of the simulation
  - **“This simulation is wrong”**

# Transfer

Can they use what they have learned?

Easier to use skills if they learn them  
where they need them

Fidelity important for transfer

- But you can't transfer it if you don't learn it in the first place

# Engagement

Want the students to feel connected with the simulation

Competing with their Xbox

# But they engage differently: The flying pot plant

# One Specific Study (Lindsay & Good 2005)

Does the substitution of technology-mediated access for direct, unmediated access lead to differences in the learning outcomes?

How do different access modes affect learning outcomes?

# The Laboratory Class

Calibration of a Piezoelectric Accelerometer  
Use of multiple control signals for calibration  
Identifying (and explaining) non-idealities

# The Class (cont'd)

3<sup>rd</sup> year Data Acquisition subject

Students' 3<sup>rd</sup> semester of control studies

Cohorts of 120 and 146 split into three  
groups – Proximal, Remote and Simulation  
access modes

$$H(\omega) = \frac{V_{\text{ACCELEROMETER}}}{V_{\text{LASER DOPPLER}}} = B\omega \cdot \angle -90^\circ$$

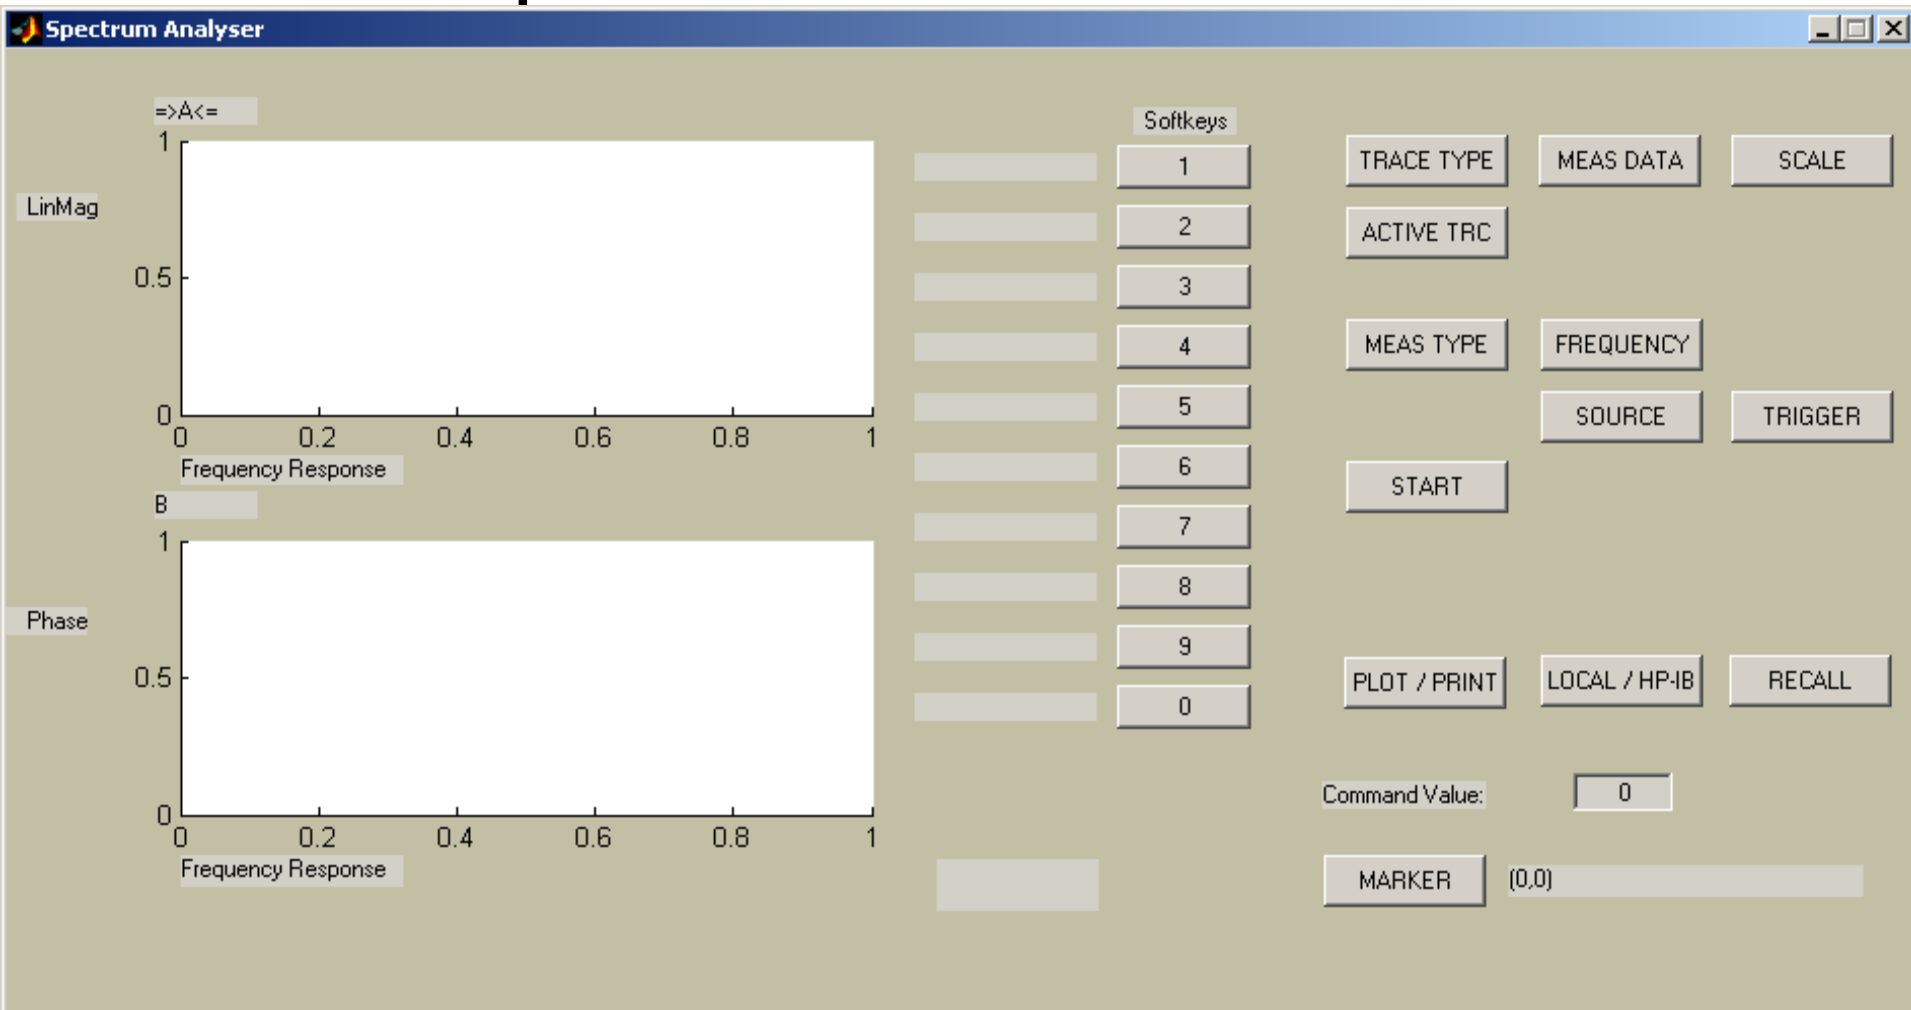

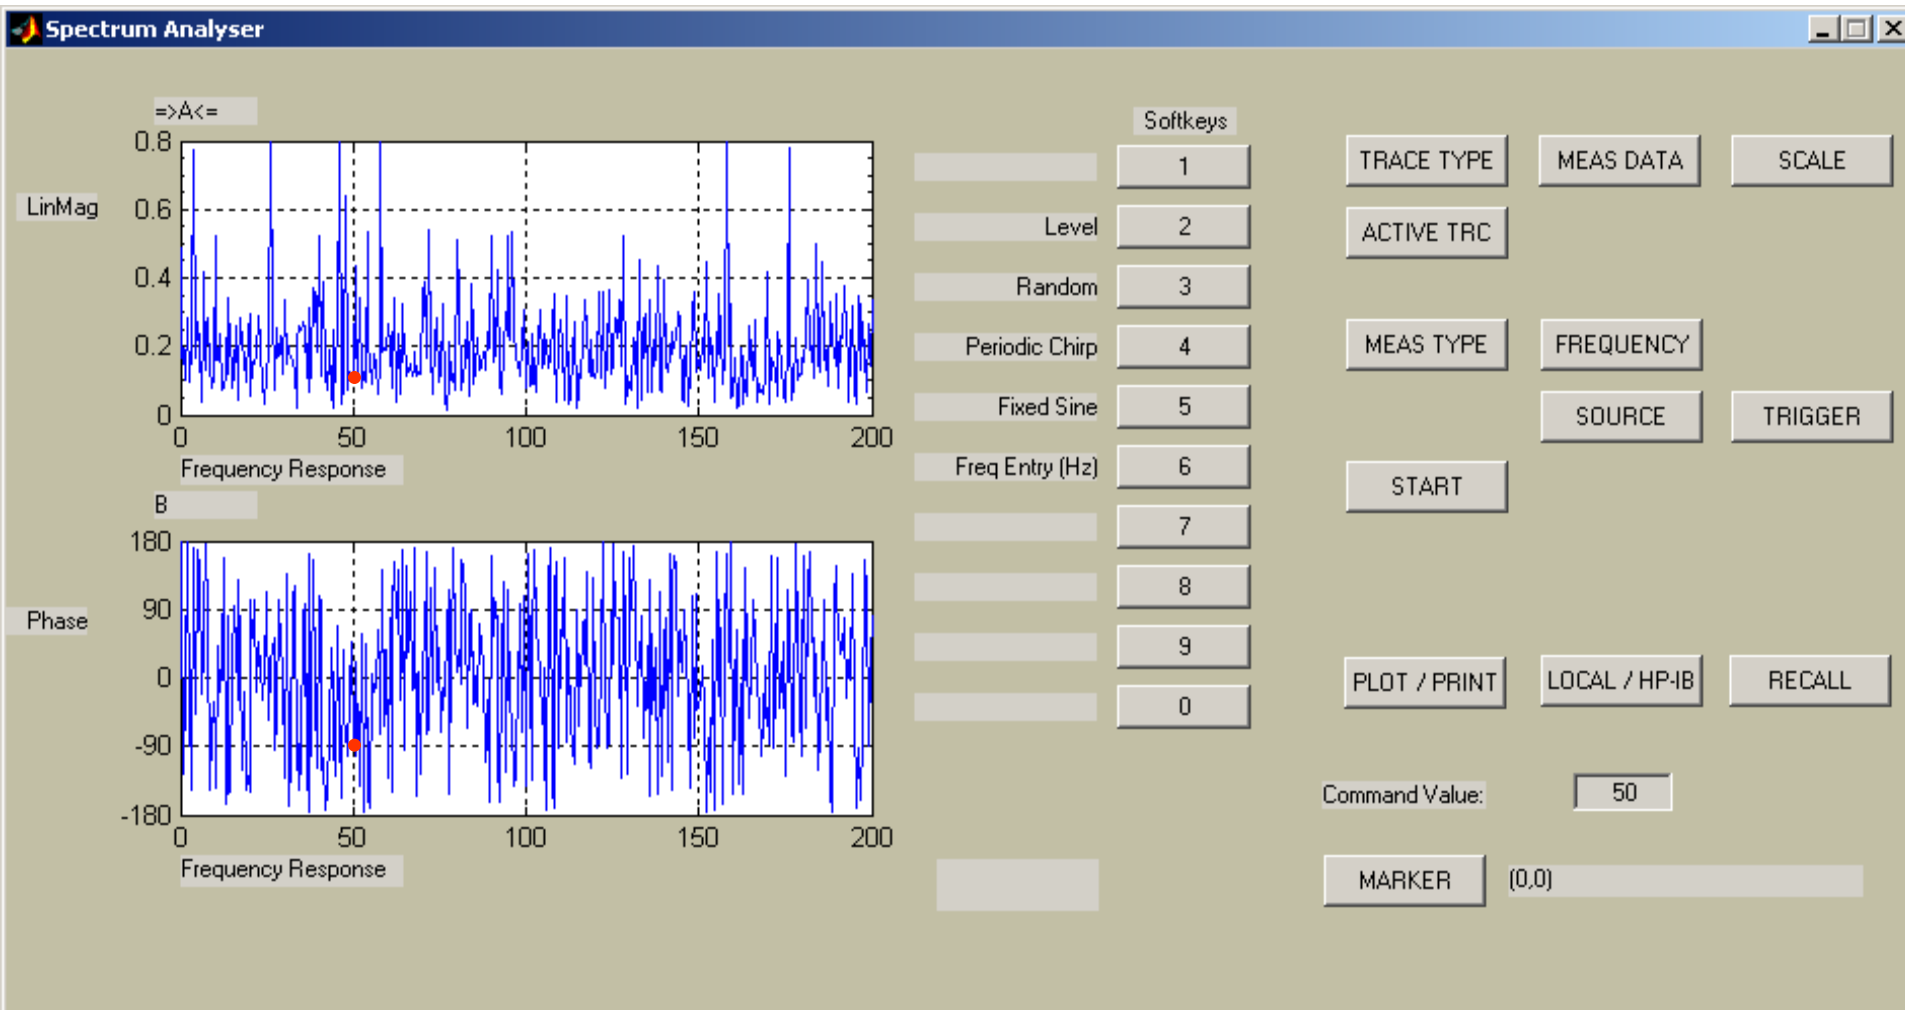

# The Computer Interface

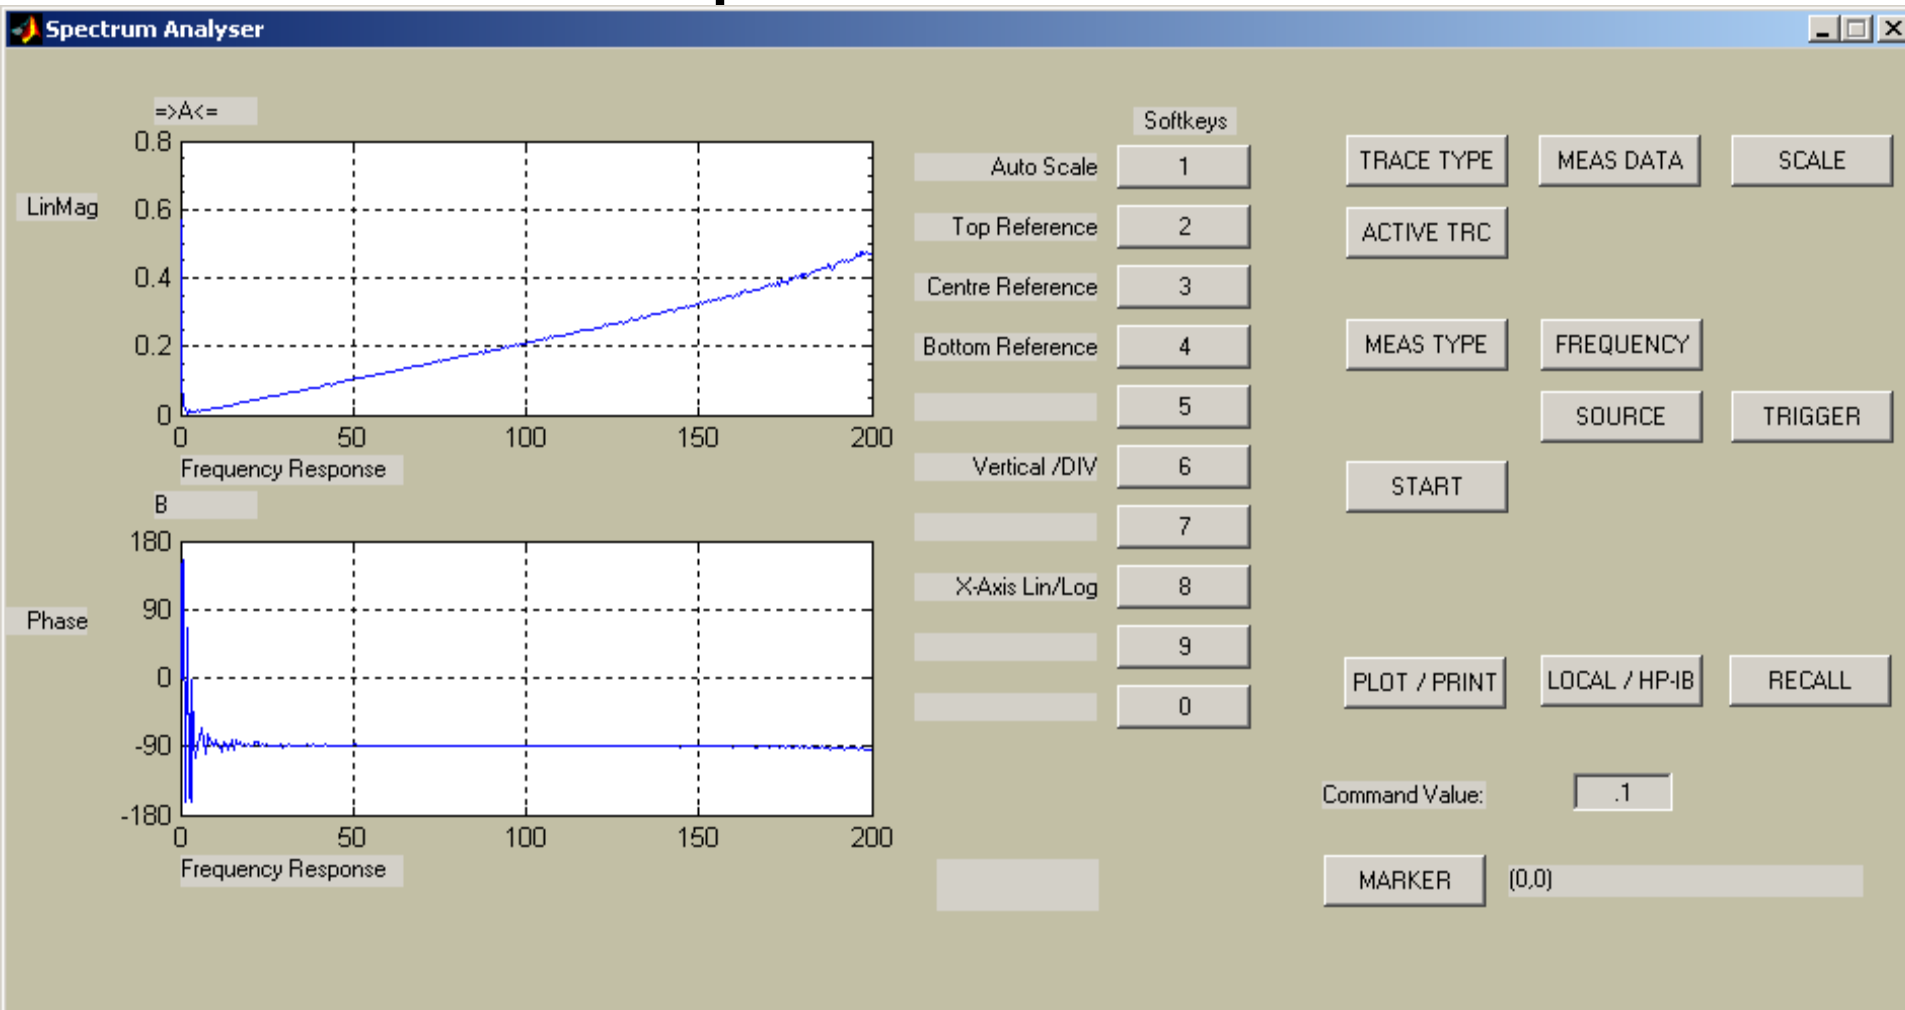

# Frequency response measurement:

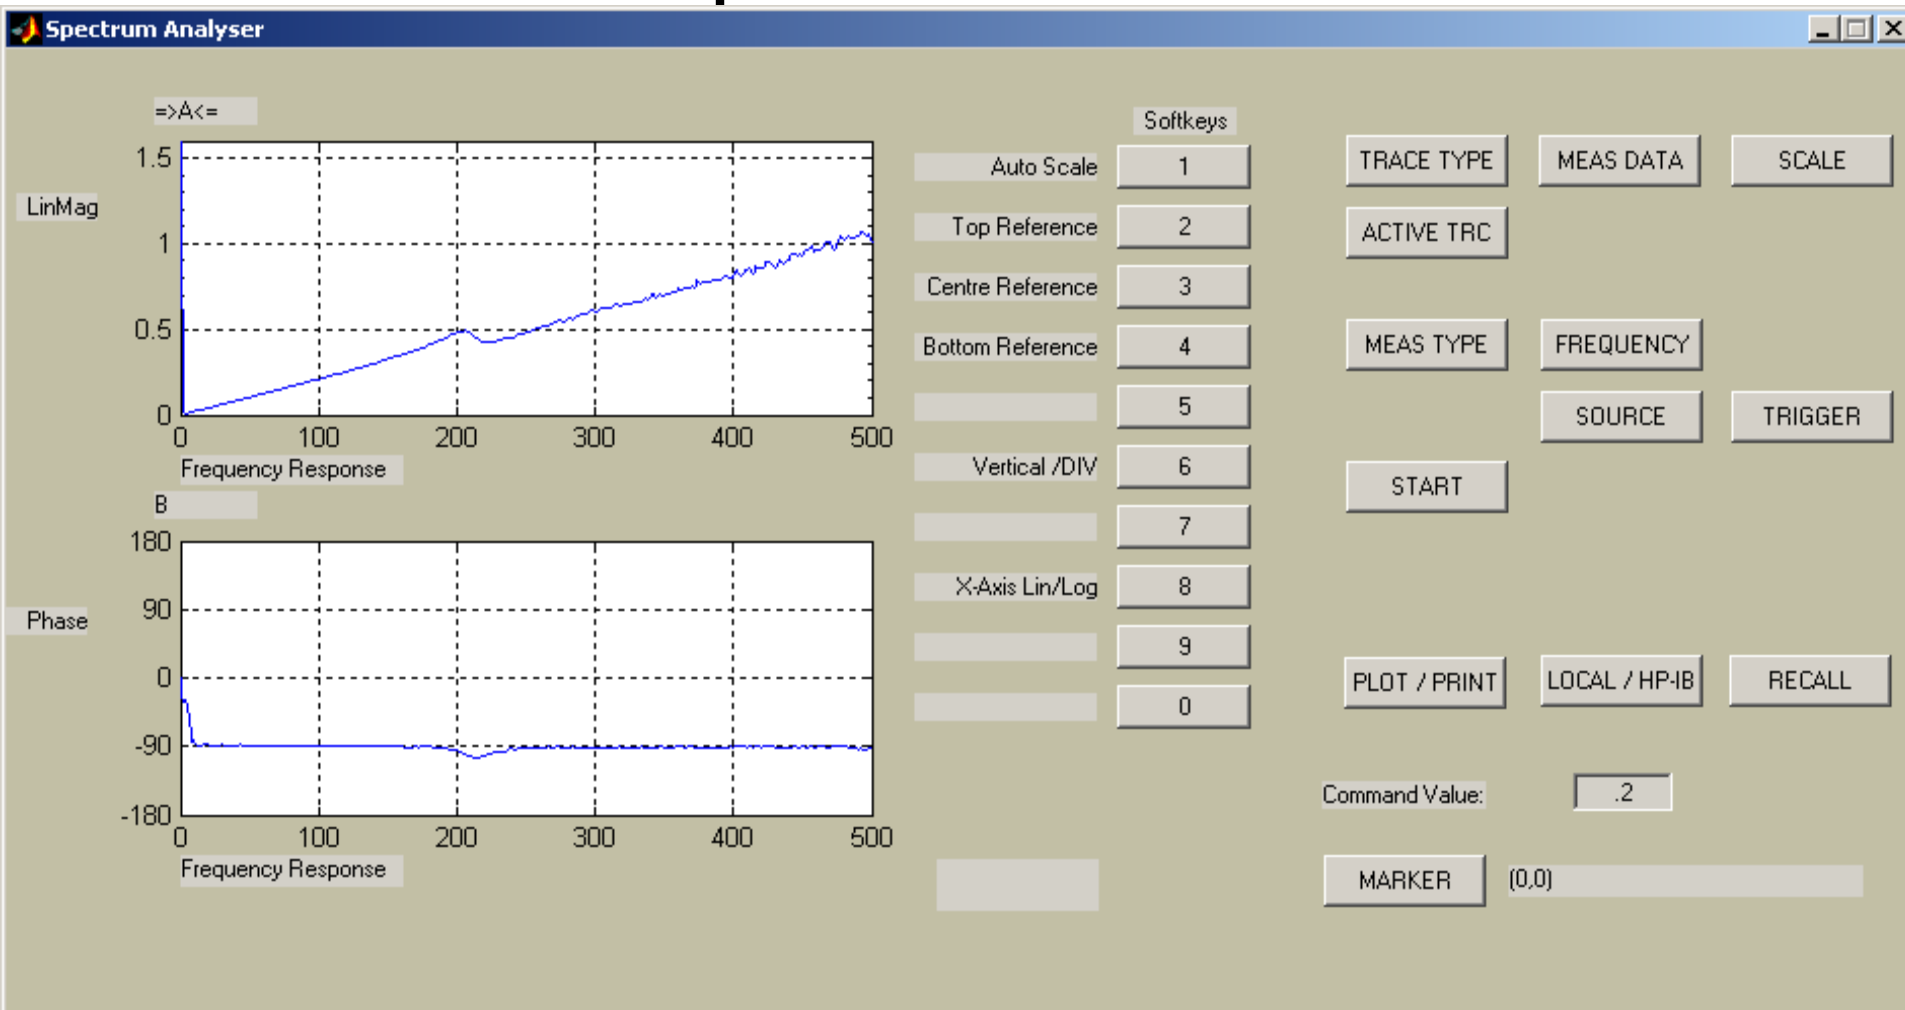

## 50 Hz Sine wave

# 0-200 Hz Chirp

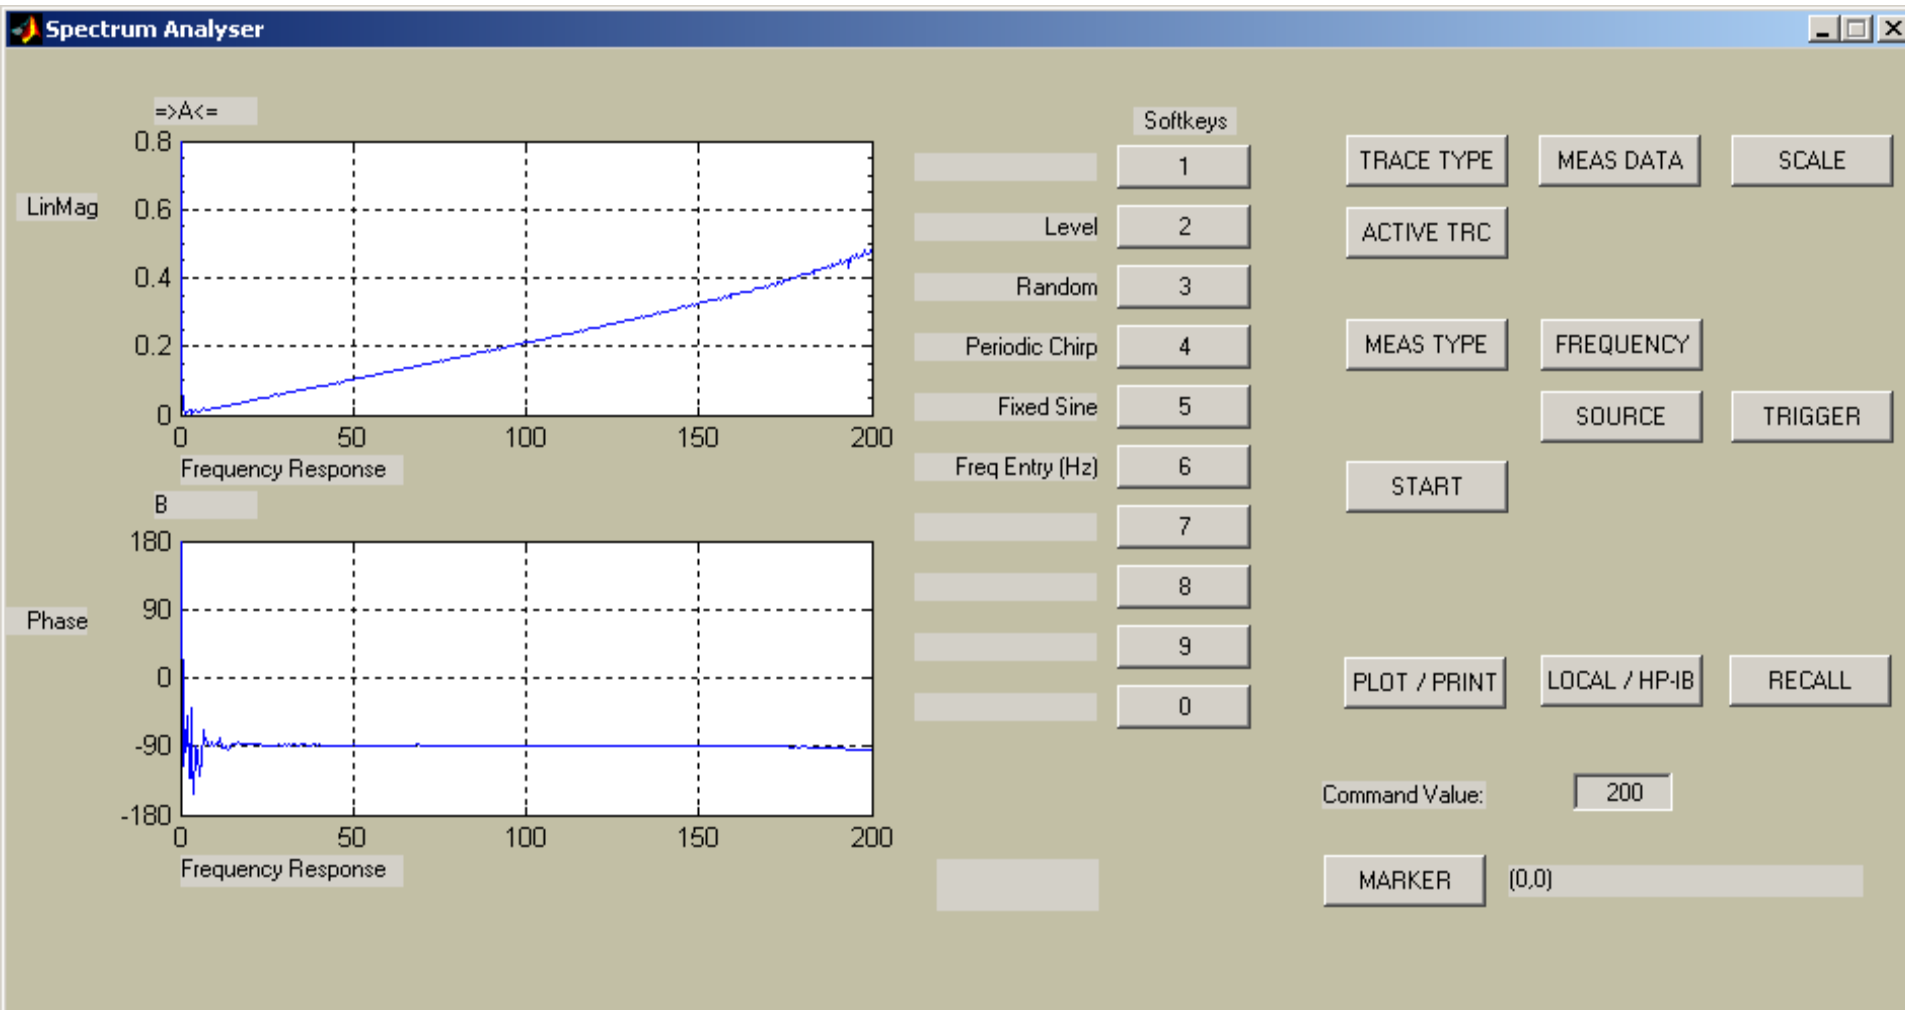

# 0-500 Hz Chirp

# White Noise

# The Findings

Not equivalent at all

Differences in perceptions of objectives

No differences in perceptions of outcomes

Differences in performance on criteria

# Differences in Learning

## Criterion Four: Deviation from the 'ideal' $H(\omega)$ vs $\omega$ straight line response.

The actual response of the system will deviate from the 'ideal' straight line response assumed in the laboratory handout.

- i) The student identifies that the response deviates from the 'ideal' straight line.
- II) The student observes that the gradient of the line changes with frequency.
- III) The student observes that response contains oscillation around the ideal straight line response.
- IV) The student observes that the response does not have a zero magnitude at  $\omega = 0$
- V) The student provides explanations to explain this deviation.
- VI) The student identifies that this deviation compromises the calibration of the accelerometer as a sensor.

# Criteria -> Outcomes

# Outcome E: Exception Handling

# Outcome F: Processing of Data

# Outcome G: Limitations of Accuracy

# Perceptions of Objectives

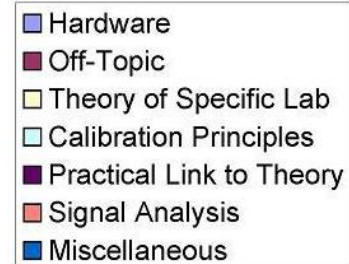

Proximal

Remote

Simulation

Category	Higher Mode	Lower Mode	P Value
Hardware	Proximal (20%)	Simulation (6%)	< .05
Hardware	Remote (20%)	Simulation (6%)	< .05
Practical Link to Theory	Proximal (13%)	Remote (4%)	< .05
Practical Link to Theory	Simulation (25%)	Remote (4%)	< .01
Miscellaneous	Proximal (15%)	Simulation (3%)	< .05

# Perceptions of Outcomes

Mostly the same  
No significant differences

# Objectives vs Outcomes

Proximal

Remote

Simulation

Proximal

Remote

Simulation

# What is happening?

Interaction between separation and interface

Richer interface potentially reduces the distance

Significant differences between remote and simulation outcomes

- Despite the same interface
- Students' attitudes and beliefs must have an impact

# Simulation mode

## Distance is set solely by the separation

- The hardware isn't real, so the way in which they interact doesn't matter

## Separation promotes abstraction

- Lose sight of the context that is being simulated, and the real hardware that is being modelled

## Promotes understanding of theory

# So What Does It All Mean?

Different access modes lead to significantly different learning outcomes, and to different perceptions of their learning outcomes

- Even through the same interface

Remote mode distance is dependent upon interface

Simulation mode distance is due to perceptions of artificiality

# A Different Kind of Different

The different access modes are significantly different learning experiences, and the students construct significantly different outcomes – outcomes that will be the prior knowledge for their future learning.

The modes are not simply interchangeable

# Not Equivalent
